

# MESSENGER at Mercury: Exploring an Enigmatic Planet

Larry R. Nittler  
Carnegie Institution  
of Washington

Night Sky Network Webinar April 18, 2016

# Mercury

May 12, 2011, from NZ (M. White, Flickr)

- Naked-eye planet, but very difficult to observe due to proximity to Sun

# Early Observations of Mercury

- Greek astronomer Eudoxus correctly measured Mercury's synodic period in ~400 BC
- One early recorded observation (Mesopotamia), Nov. 15, 265 BC
- Earliest telescopic observations by Galileo and Harriot, 1609

Eudoxus of Cnidus, 390 – 340 BC

Thomas Harriot, 1560-1621

Galileo Galilei, 1564-1642

# Early Observations of Mercury

- Discovery of phases by Zupus (1639) proved the Copernican theory that planets orbit the Sun, not the Earth

- Early maps

G. Schiaparelli

P. Lowell

E.  
Antoniadi

# Mercury Is Difficult to Study

...by telescope ...

...or spacecraft.

Only prior visit was by  
Mariner 10, 1974-1975

# Mercury Exploration

## Contributions of Mariner 10 flybys:

- Imaged 45% of Mercury's surface
- Discovered Mercury's magnetic field and dynamic magnetosphere
- Detected H, He, O in Mercury's "exosphere"

Mariner 10 mosaic of the Caloris basin

# Mercury Exploration

## Contributions of Earth-based astronomy

- Discovery of Mercury's 3:2 spin-orbit resonance (1965)
  - 3 days in 2 years
- Discovery of sodium (1985), potassium (1986), and calcium (2000) in Mercury's exosphere

Na emission  
Potter et al. 2002

# Mercury Exploration

## Contributions of Earth-based astronomy

- Discovery of Mercury's polar deposits (1992)
- Discovery of Mercury's molten outer core (2007)

Harmon et al. 1999

# Mercury: planet of extremes

- Smallest, densest planet
- Closest to Sun
- Highest diurnal variation in temperature
  - $-170\text{ }^{\circ}\text{C}$  to  $+430\text{ }^{\circ}\text{C}$
- Very high Fe:silicate ratio
  - Core  $\sim 70\%$  of mass,  $80\%$  radius
- Mercury and Earth are the only inner planets with magnetic fields

“end-member of planet formation”

# Extrasolar Planetary Context

# Extrasolar Planetary Context

# MESSENGER

- First spacecraft to orbit Mercury
- 7<sup>th</sup> NASA *Discovery* mission
  - PI: Sean C. Solomon

# Challenge: Surviving at Mercury

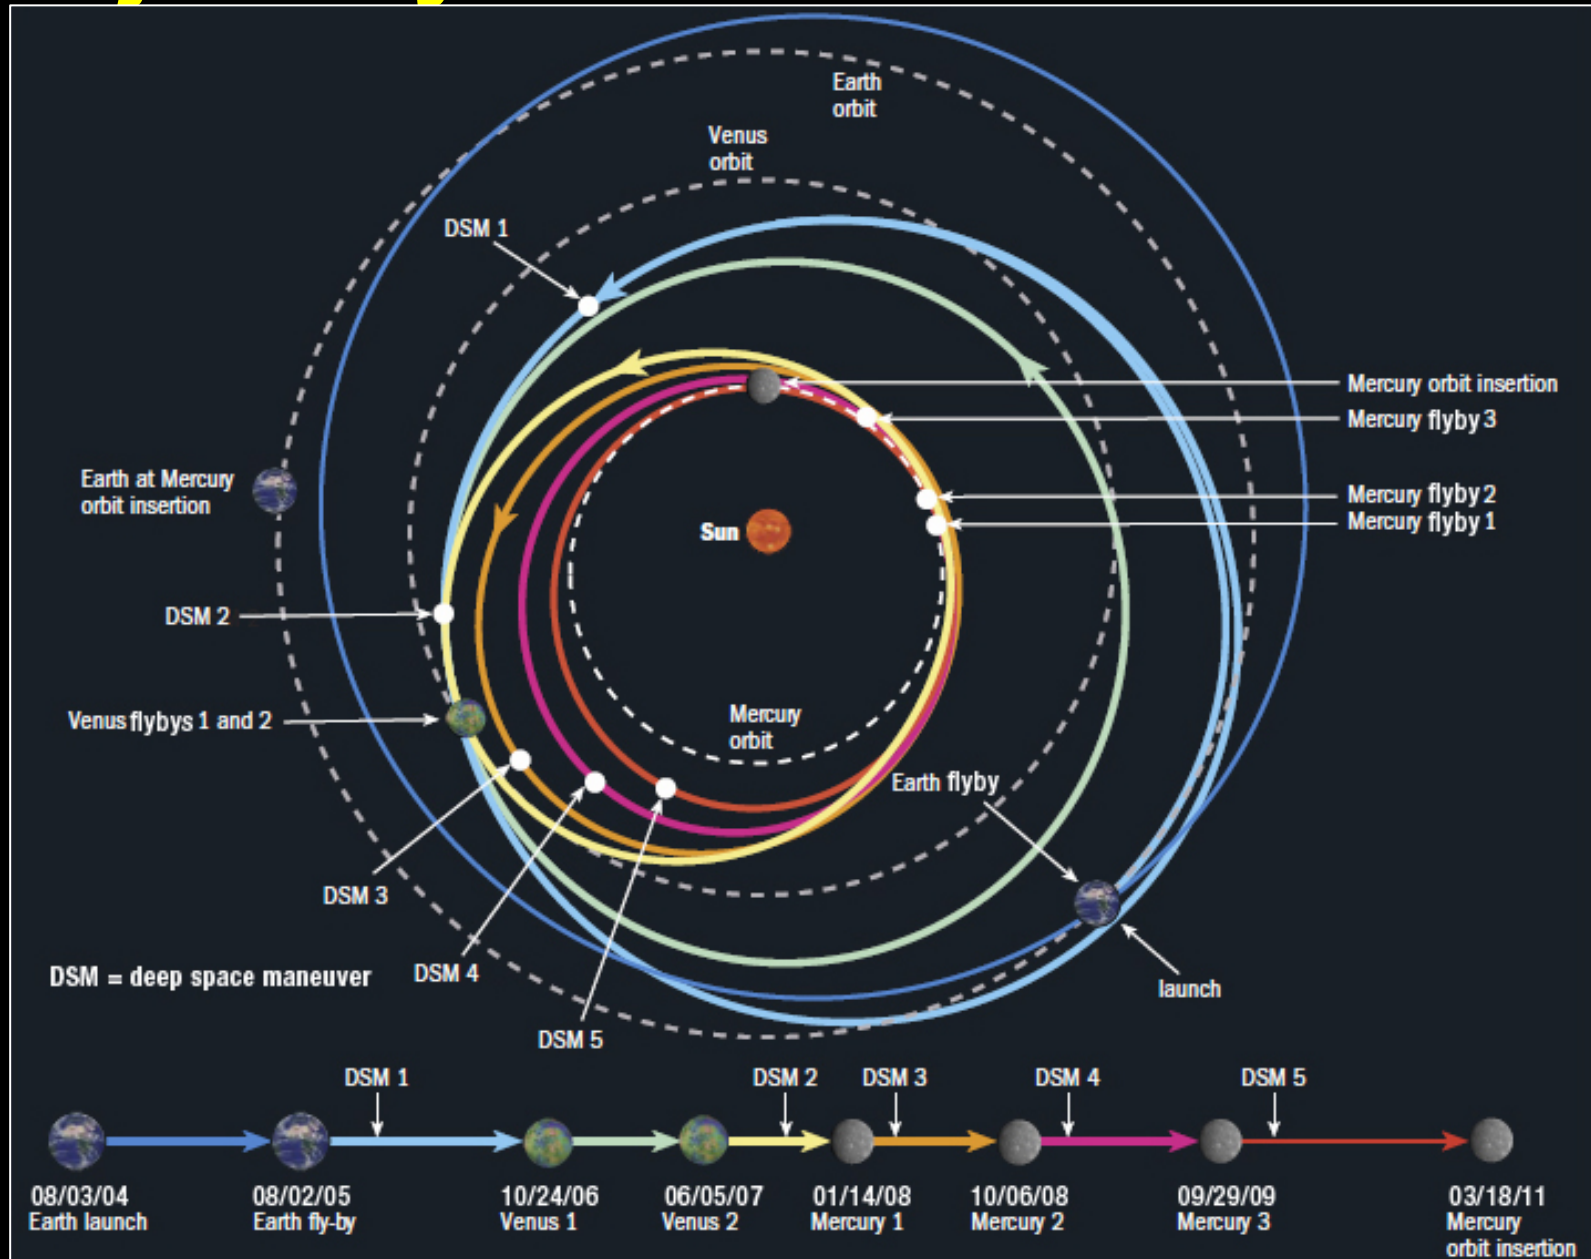

Ceramic cloth sunshade

Solar panels 2/3 mirrors

# Trajectory allowed orbit insertion

# MESSENGER's Guiding Science Questions mapped to Measurement Objectives

## Science Questions

Why is Mercury so dense?

---

What is the geological history of Mercury?

---

What are the nature and origin of Mercury's magnetic field?

---

What are the structure and state of Mercury's core?

---

What are the radar-reflective materials at Mercury's poles?

---

What are the important volatile species and their sources and sinks near Mercury?

## MESSENGER Measurement Objectives

Map the elemental and mineralogical composition of Mercury's surface

---

Globally image the surface at a resolution of hundreds of meters or better

---

Determine the structure of the planet's magnetic field

---

Measure the libration amplitude and gravitational field structure

---

Determine the composition of the radar-reflective materials at Mercury's poles

---

Characterize exosphere neutrals and accelerated magnetosphere ions

# MESSENGER's Scientific Payload

**Vibration test, December 2003**

**Launch, August 2004**

# Getting to Mercury

Earth (August 2005)

Venus (October 2006)

# Mercury Flybys (2008-2009)

M1 (Jan 2008)

M2 (Oct 2008)

- >90% of surface imaged

M3 (Sep 2009)

# Mercury Flybys (2008-2009)

M1 (Jan 2008)

M2 (Oct 2008)

- >90% of surface imaged

Mission also first spacecraft to use solar sailing!

M3 (Sep 2009)

# Mercury Orbit Insertion (March 18, 2011)

# Mercury Orbit Insertion (March 18, 2011)

Feb 2013: MESSENGER imaging  
coverage reached 100%

Mercury in "true" color – RGB: 630, 560, 480 nm

Mercury in  
"enhanced"  
color –  
RGB: PC2,  
PC1,  
430/1000

# Illumination Matters

**MARINER 10**

**MESSENGER**

# Formation of Mercury

- Terrestrial planets shared common formation process:  
*accretion*

Dust -> Rocks -> Planetesimals -> Planets

- Why does Mercury have such a large Fe core?

# (pre-MESSENGER) Mercury Formation Models

- Accretion at high-T? (Lewis 1973)
- Evaporation by hot Sun? (Cameron 1985)
- Giant impact stripping? (Wetherill, Benz 1988)
- Metal-silicate segregation (Weidenschilling 1978)

# Composition is key

- Surface elemental composition depends on starting materials and history
- MESSENGER had 3 instruments for measuring surface composition

- X-ray Spectrometer (XRS)
- Gamma-ray Spectrometer (GRS)
- Neutron Spectrometer (NS)

# Periodic Table of Elements

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18

# Volatile Elements on Mercury

(Peplowski et al., 2011,2012)

# Volatile Elements on Mercury

Mercury *not* volatile-depleted (similar to Mars, Earth)

(Peplowski et al., 2011, 2012)

# Volatile Elements on Mercury

Mercury *not* volatile-depleted (similar to Mars, Earth)

(Peplowski et al., 2011, 2012)

Also rich in volatiles Na and Cl!

# Major elements on Mercury

- X-ray Spectrometer data indicate Mercury Mg-rich, Al-Ca-poor, relative to Earth and Moon surface

# Major elements on Mercury

- X-ray Spectrometer data indicate Mercury Mg-rich, Al-Ca-poor, relative to Earth and Moon surface

# Major elements on Mercury

Mg/Si

Al/Si

Lower

Higher

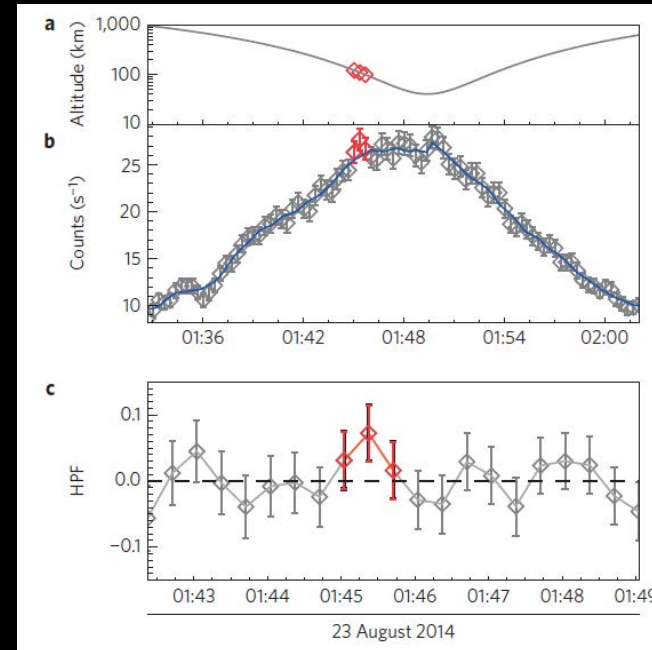

# High Sulfur, Low Fe

- S much higher; Fe much lower than other terrestrial planet crusts
  - Earth's Crust: ~300 ppm S, 5 wt% Fe
- Indicates formation under much less oxidizing conditions than other planets

# Carbon on Mercury!

Peplowski et al. *Nature Geoscience* 2016

- Mercury very dark; darkest materials excavated from deep in crust
- Low-altitude neutron measurements, spectra most consistent with graphite
  - average  $\sim 1$  wt% graphite at surface
  - Buried remnant of Mercury's first crust??

# Mercury is a volatile-enriched, chemically reduced planet

- Rules out many pre-MESSENGER formation models involving very high temperatures
  - High-temperature accretion
  - Evaporation of larger mantle by bright early Sun
  - Stripping of larger mantle by giant impact??  
[still viable, but no reliable geochemical predictions]
- Mercury made of different mix of materials than other terrestrial planets

# Geologic History: Widespread Volcanism

Northern Plains

*Murchie et al. [2008]*

*Head et al. [2011]*

# New Landform: “Hollows”

- Bright deposits within impact craters show fresh-appearing, rimless depressions, commonly with halos.
- Formation from recent volatile loss?

# Tectonics

- Mercury covered with “lobate scarps” (cliffs)
- Due to contraction of planet as it cooled

50 km

- Detailed analysis of MESSENGER data indicates much more contraction than previous work (Byrne et al. 2014)

# Mercury Geophysics

- Radio Science combined with topography (left, from laser altimetry) to infer gravity map (below)
- Use to constrain interior

*Zuber et al. Science [2012]*

*Smith et al. Science [2012]*

# Internal Structure

- Model of interior based on gravity field
  - Based on millions of internal structure models (Smith et al. 2012, Hauck et al. 2013)
  - Top of liquid core at  $r=2020 \pm 30$  km [ $R_{\text{planet}}=2440$  km]
- High density (FeS) layer at base of mantle not required but consistent with data and may be expected for highly reduced planet

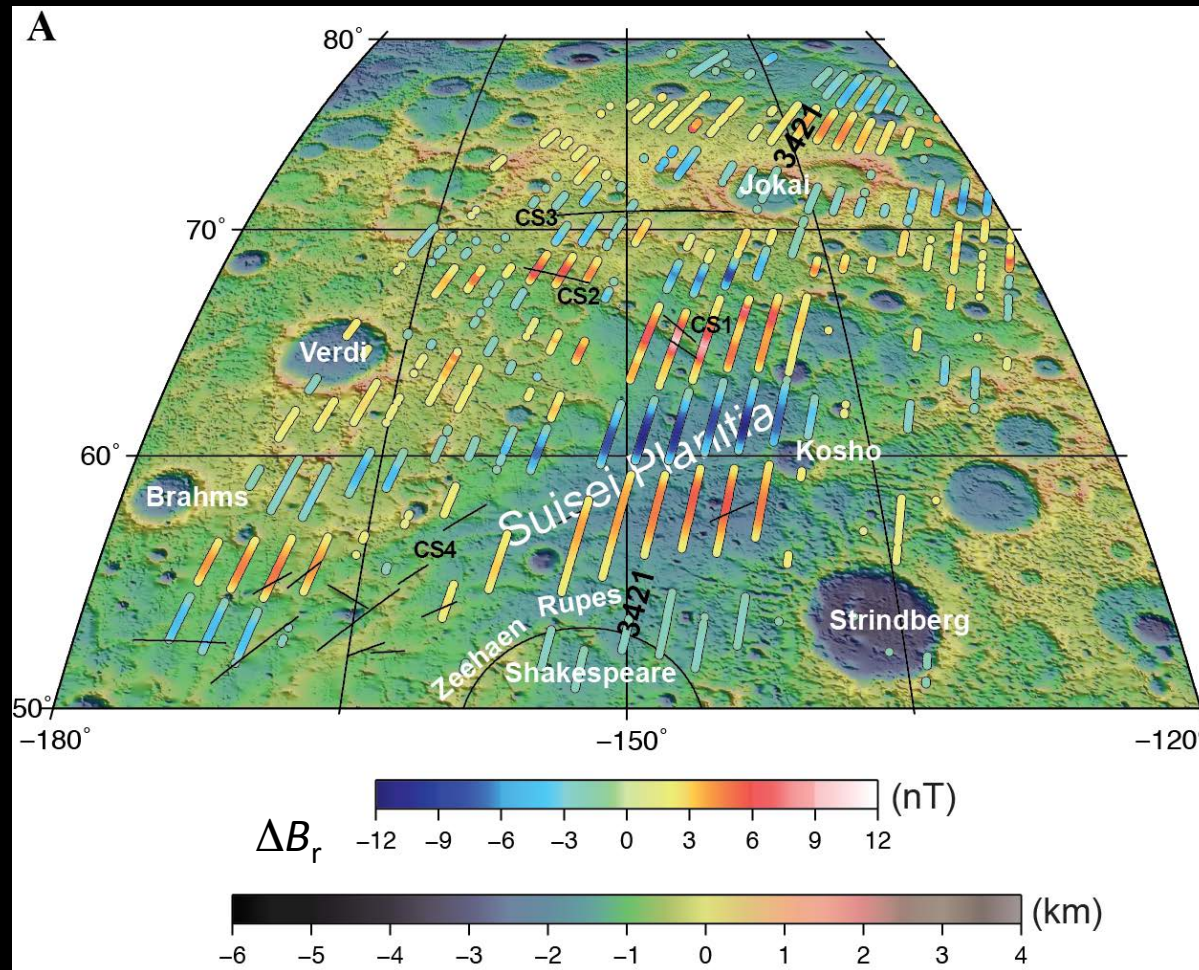

*Hauck et al. [2012]*

# Magnetic Field: Dipole with Equator Offset

- Magnetic field is dipolar and of the same sense as that of the Earth, but displaced northward from the planet center by 480 km
- Large offset is unprecedented in the solar system and puts constraints of the generation mechanism

# Remanent Crustal Magnetism

*Johnson et al. 2015*

- At low altitude (<60 km), saw magnetic field variations from surface –preserved in crust
- Thermal preservation of magnetization over ~4 Gyr!

# Mercury's Magnetosphere

- Interaction of Mercury's weak magnetic field with solar magnetic field leads to complex and dynamic “magnetosphere”
  - Playground for space plasma physicists

Slavin et al. [2009]

# Mercury's Exosphere

- Na, Ca, Mg most abundant species
- Asymmetries in distributions: different source mechanisms
  - Na uniformly distributed
  - Ca shows dawn enhancement
  - Both show seasonal variability

# Mercury's Polar Deposits

- Deposits with radar characteristics of water ice discovered in polar craters by ground-based astronomy in 1992.
- Imaging of polar regions confirms that radar-bright deposits occur in permanently shadowed regions
- Thermal modeling indicates ice/organic stability where deposits located

# Mercury's Polar Deposits

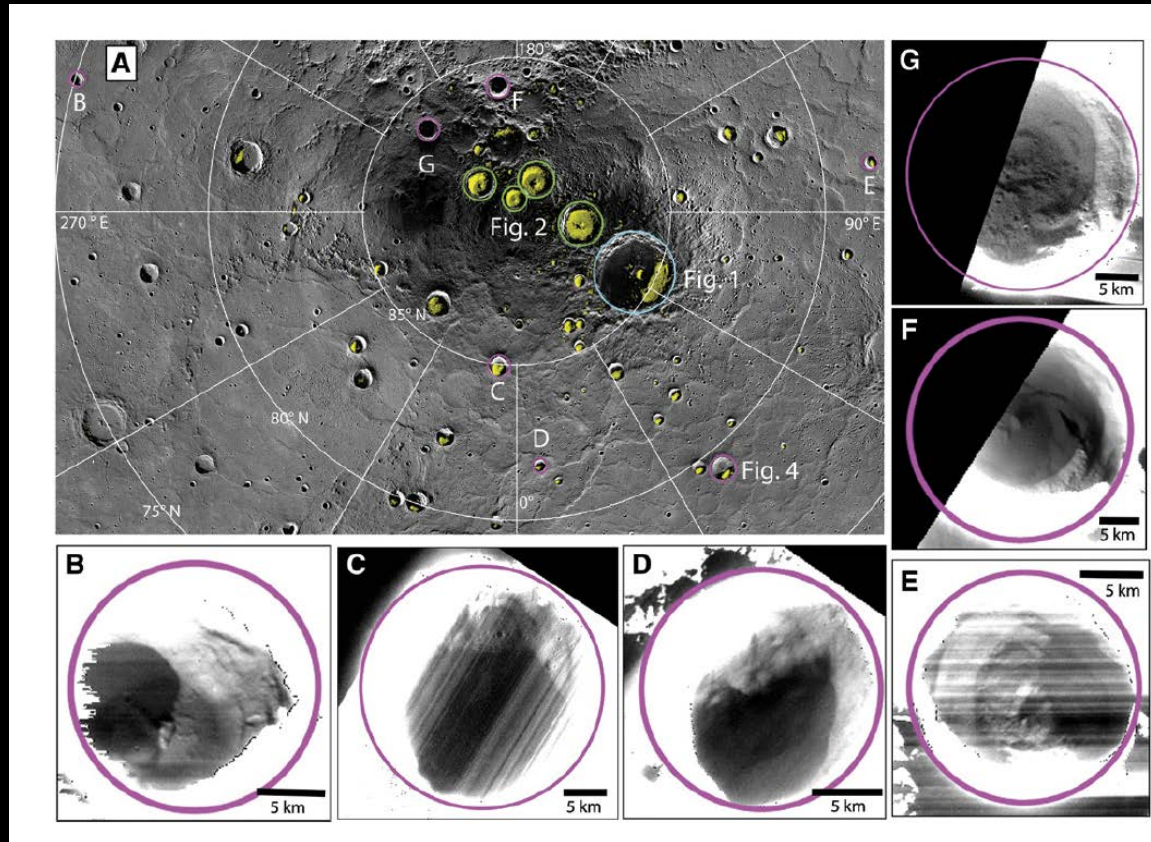

- Neutron emissions sensitive to hydrogen
- Decrease at Mercury's North pole quantitatively matches expectation if deposits are water ice

*Lawrence et al., Neumann et al., Paige et al.  
Science [2013]*

# Mercury's Polar Deposits

- Deep MESSENGER imaging also reveals brightness variations in deposits (Chabot et al , 2014)

# End of mission

- First use of helium as spacecraft propellant!

# FIRST

**Left Image Center Latitude:**  $-53.3^{\circ}$   
**Left Image Center Longitude:**  $13.0^{\circ}$  E  
**Left Image Resolution:** 2.7 kilometers/pixel  
**Left Image Scale:** The rayed crater Debussy has a diameter of 80 kilometers (50 miles)

# LAST

**Right Image Center Latitude:**  $72.0^{\circ}$   
**Right Image Center Longitude:**  $223.8^{\circ}$  E  
**Right Image Resolution:** 2.1 meters/pixel  
**Right Image Scale:** This image is about 1 kilometers (0.6 miles) across

# Acknowledgements

- MESSENGER Science Team, Engineers and Mission Controllers

# MESSENGER at Mercury

- MESSENGER was an extraordinarily successful mission
- Despite its small size, Mercury is a weird and wonderful world.
  - Different in fundamental ways from other terrestrial planets
  - May provide valuable information for extrasolar planets
